The present invention relates to a thermoplastic resin composition which is designed to be used for an extended period of time under high-temperature and high-humidity conditions. More particularly, it relates to a thermoplastic resin composition suitable for use in the manufacture of molded articles such as an automobile part, which are formed into a finished product without deterioration in the properties thereof during use, as well as to a thermoplastic resin molded article formed by the use of the resin composition. Synthetic resins are usually poor in heat resistance and undergo deformation at the ordinary temperature due to their internal cohesive property and their nature of tending to self-heal. In contrast, thermoplastic resins such as polyamides, polyesters, polypropylene and polyethylene show excellent heat resistance to a high level. However, they cannot be used as exterior materials of automobiles, electric machinery, etc. as they do not possess flame retardancy and scratch resistance required for such use. The use of flame retardant and/or scratch resistant additives in general-purpose thermoplastic resins is well known in the art. Examples of these additives are those containing bromine or phosphorus. In order to achieve a sufficient effect of these additives, it is necessary to add them in a large amount. This results in a deterioration of physical properties of the thermoplastic resin, so that the composite molded article obtained becomes defective and considerably deteriorated in quality. According to known methods, it is possible to improve flame retardancy and/or scratch resistance by using a bromine-containing or phosphorus-containing compound. However, these methods also cause deterioration in physical properties and consequently result in a defective product. As a result, the known methods are not satisfactory from the practical point of view. In addition, some additives tend to be exuded from a molded article
